

This report explores practical digital, data and AI opportunities to help Healing Hands Network make its existing work easier to **manage, measure and share**. It focuses on realistic, low-cost improvements to website reliability, search visibility, supporter journeys, impact reporting, volunteer administration and safe AI-assisted workflows. The aim is to reduce manual effort, strengthen visibility and support the charity's existing mission.

Digital, Data and AI Support Ideas for Healing Hands Network

A technical review of possible ways to support website management, impact reporting, supporter journeys and AI-assisted administration

Roger Campbell – AI Engineer @ Ch3rry Pi3

Purpose of this note

This note sets out a number of **digital, data and AI-related ideas** that could support Healing Hands Network's existing work. It is written from a technical perspective, rather than as a critique of the charity's current approach. Healing Hands Network has clearly been operating for many years and already has a strong history, established relationships, volunteers, supporters and practical experience in Bosnia, Ukraine and with UK veterans.

The ideas below are therefore intended as possible ways to make existing activity **easier to manage, easier to evidence, easier to share, and easier for supporters to engage with online**.

A full technical review would depend on access to the relevant systems. In practical terms, deploying any changes would likely require access to some or all of the following: **domain and hosting account, website files or CMS, Facebook/Instagram admin access, Google account access, Google Search Console or Analytics if already set up, email/newsletter systems, and any donation or fundraising platform accounts**. Without that access, it would still be possible to produce recommendations, mock-ups, content templates or prototype tools, but not necessarily deploy changes directly.

The aim would not be to change the character of Healing Hands Network's work, but to explore whether technical support could make some existing processes **more reliable, less time-consuming, easier to update and easier to measure**.

Brief public overview

Healing Hands Network is listed by the Charity Commission as registered charity number **1080268**. The Charity Commission describes the charity's work as sending volunteer qualified complementary therapists to treat people suffering physical and mental trauma following war and its aftermath, including people who may be suffering PTSD. It also records work with civilians overseas, currently including **Bosnia and Herzegovina** and **Ukraine**, as well as veterans of the armed forces in the UK. The same description states that the charity helps Ukraine by sending donated medical and humanitarian aid and vehicles as needed (**Charity Commission, accessed 2 July 2026**).

The latest Charity Commission overview shows reporting as up to date, with data for the financial year ending **31 December 2024**. It records **total income of £49,309, total expenditure of £35,827, 2 trustees and 25 volunteers** (**Charity Commission, accessed 2 July 2026**).

The Charity Commission full register page also records Healing Hands Network as a **charitable company**, company number **03802473**, recognised by HMRC for **Gift Aid**,

and lists the official website as www.healinghandsnetwork.org.uk (**Charity Commission, accessed 2 July 2026**). Companies House also shows that accounts made up to **31 December 2024** were filed on **19 August 2025** (**Companies House, accessed 2 July 2026**).

Public fundraising routes connected to Healing Hands Network include a **JustGiving charity profile**, **GoFundMe campaign-based fundraising** connected to Ukraine aid, and a **GivingLottery** page where supporters can select Healing Hands Network as the cause they support (**JustGiving, accessed 2 July 2026; GoFundMe, accessed 2 July 2026; GivingLottery, accessed 2 July 2026**).

This suggests that the opportunity may not be to create fundraising routes from scratch, but to make the existing routes **easier to find, easier to understand, easier to track, and easier to connect to specific campaigns, impact updates and supporter journeys**.

1. Technical website review and light-touch refresh

A useful first step would be a **technical review of the current website**, rather than an immediate full rebuild. Since the site was originally put together some time ago, it may be possible to make meaningful improvements without changing the overall character of the charity or creating a large maintenance burden.

The review could look at the hosting setup, site structure, mobile display, page speed, accessibility, broken links, security certificates, backup arrangements, analytics, search indexing and how easy it is for Susan or another trusted person to update pages.

It would also be worth checking whether the site is static HTML, WordPress, Wix, Squarespace, custom code or another setup. That would determine whether the best approach is to work with the existing site, move it into a simple CMS, or create a low-maintenance replacement that preserves the current content while making updates easier.

One immediate technical point is simply to check **site reliability and accessibility**. During any technical review, the official website should be tested from several devices and networks, because intermittent loading issues can affect supporters, volunteers, donors and search engine indexing. This is a practical infrastructure point, not a criticism of the charity's work.

The aim would be practical: make the website **easier to maintain, easier for visitors to use, and easier for search engines to understand**.

2. Donation and support journey audit

Because Healing Hands Network already appears to have several ways for people to support the charity, the most useful technical work may be to **audit and organise those routes**, rather than immediately recommend another platform.

From public sources, the current support routes appear to include at least **JustGiving**, **GoFundMe**, **GivingLottery**, and Gift Aid recognition through HMRC as recorded by the Charity Commission (**Charity Commission, accessed 2 July 2026; JustGiving, accessed 2 July 2026; GoFundMe, accessed 2 July 2026; GivingLottery, accessed 2 July 2026**).

A sensible next step would be to map each route and identify what each one is best for. For example, JustGiving may be useful as a general charity giving and fundraiser route. GoFundMe may be useful for **specific campaigns or public sharing**. GivingLottery may be useful for **small recurring support**. Gift Aid recognition is important for UK taxpayer donations. Any existing standing order or sponsorship forms could also be included in this map if they are currently in use.

The technical opportunity is to make these routes clearer and more measurable. This could involve creating a single **“Support Us” hub page** that links to the existing donation methods, with tracking links so the charity can see which routes people use. It could also involve campaign-specific pages that explain a current need and then direct people to the most appropriate existing giving route.

This would avoid replacing what already works, while still making the overall supporter journey easier to follow.

3. Impact data and reporting

One of the strongest opportunities is to help the charity capture and present impact in a simple, repeatable way. This is not about changing the charity’s work; it is about making the work easier to **evidence, summarise and share**.

Impact reporting is widely used across the charity sector. NPC’s *Principles of Good Impact Reporting* explains that good impact reporting helps charities and social enterprises tell their own story about impact, shifting attention away from narrow concerns such as administration costs and towards the difference made in people’s lives (**NPC, 2012**). The Charity Commission’s public benefit reporting guidance explains that charity trustees must report on how they have carried out their charity’s purposes for the public benefit (**Charity Commission, 2013**).

A simple impact system for Healing Hands Network could begin as a spreadsheet or lightweight database. It could track items such as **therapy trips, volunteer hours, aid**

deliveries, vehicles sent, funds raised, campaign costs, countries supported, partner organisations, photos, quotes and short notes on outcomes. The important point is not to over-engineer it. The aim would be to make the data easy to update and easy to turn into reports.

Once that information is captured consistently, it could support a simple impact page on the website, quarterly or annual impact summaries, short social media updates, donor thank-you updates, grant applications, trustee reports and campaign-specific updates.

Several charities and humanitarian organisations make impact visible online in different ways. Nova Ukraine presents headline impact figures such as total aid delivered, people helped and aid delivered (**Nova Ukraine, accessed 2 July 2026**). DEC's Ukraine Humanitarian Appeal page explains the amount raised, the number of people helped, the timeframe of the appeal and the closure of programmes funded by the appeal (**DEC, accessed 2 July 2026**). The British Red Cross Ukraine page presents headline numbers about the Red Cross and Red Crescent response, including food and hygiene kits distributed, people supported with clothing and household items, and people trained in first aid (**British Red Cross, accessed 2 July 2026**).

For Healing Hands Network, this could be done in a proportionate way. It does not need to look like a large national charity's report. A smaller, sincere, well-structured impact page or PDF could be very effective, particularly if it helps supporters understand what has been achieved and what support is currently needed.

4. Google visibility and search

There may be a useful technical opportunity around **search visibility**, especially for people looking for charities connected with Ukraine aid, Bosnia war trauma support, complementary therapy volunteering, or veterans support.

This does not mean trying to “game” Google. The practical aim would be to help Google and visitors understand the charity's work more clearly. [Google Ad Grants](#) is specifically designed to help eligible nonprofits raise awareness, attract donors and recruit volunteers using Google Search ads. Google states that qualifying nonprofits can access up to **\$10,000 USD per month** in search ads (**Google Ad Grants, accessed 2 July 2026**).

A review could include checking whether the site has clear page titles, descriptive headings, readable URLs, a sitemap, Google Search Console, structured data, working internal links, relevant image alt text, and analytics to understand what people are searching for.

There may also be value in creating or improving dedicated pages for the charity's main areas of activity: **Bosnia and Herzegovina, Ukraine humanitarian aid, UK veterans, volunteer therapists and ways to support**. These pages would not need to be written in a sales-like way. They would simply make it easier for Google and visitors to understand the different strands of the charity's work.

[Google for Nonprofits](#) and [Google Ad Grants](#) may therefore be worth exploring. UK eligibility would need to be checked against Google's country-specific nonprofit eligibility requirements. Google's UK eligibility guidance states that organisations must be registered as charitable organisations and verified by Google for Nonprofits' validation partner (**Google for Nonprofits, accessed 2 July 2026**).

If Healing Hands Network is eligible, Google Ad Grants could potentially help the charity appear when people search for relevant terms such as Ukraine aid charities, volunteer therapist opportunities, Bosnia trauma support or veterans charity support. The work here would involve eligibility checks, account setup, landing pages, conversion tracking and ongoing optimisation.

5. Social media scheduling and content workflow

Healing Hands Network already appears to have public social media activity. The opportunity here is not necessarily to do "more social media," but to reduce the manual effort involved in keeping supporters updated.

[Meta Business Suite](#) may be useful because it is designed to manage Facebook, Instagram and Messenger activity from one place. Meta's help material states that posts can be created and scheduled for Facebook and Instagram through Meta Business Suite (**Meta, accessed 2 July 2026**).

A practical technical setup could include a simple monthly workflow. Susan or another volunteer could provide rough notes, photos or voice notes from current activity. Those could then be turned into draft updates for Facebook, Instagram, the website and email. AI could help draft and reformat updates, but a human should always review anything before publication.

This would be particularly useful where the same core update needs to appear in several formats. For example, a Ukraine delivery update could become a website post, a Facebook post, a short Instagram caption, a donor email paragraph and a record in the impact database.

The benefit is **consistency without adding unnecessary admin**.

6. AI-assisted admin and reporting

AI could be useful for Healing Hands Network, but it should be applied carefully. The Charity Commission has noted that AI may help charities free up time spent on resource-intensive tasks, but also highlights risks around data security, GDPR, copyright and harmful content. It also says AI should be used responsibly in a way that furthers the charity's purposes (**Charity Commission, 2024**). The ICO's AI and data protection risk toolkit is designed to provide practical support to organisations to reduce risks to individuals' rights and freedoms caused by their own AI systems (**ICO, accessed 2 July 2026**).

The safest starting point would be internal, low-risk use cases that do not involve sensitive beneficiary data. For example, AI could help turn rough notes into draft website updates, summarise meeting notes, draft donor thank-you messages, create first drafts of grant applications, convert project updates into social posts, produce monthly impact summaries, organise frequently asked questions, or summarise public guidance.

NCVO has noted that AI can help small charities with activities such as summarising meetings, creating social media content, writing board papers, bringing campaigns to life, grant applications, governance admin and evaluation/reporting (**NCVO, accessed 2 July 2026**). This aligns well with a cautious, practical approach: using AI to support admin and communication, not to replace human judgement.

Given the nature of Healing Hands Network's work, AI should not be used to provide therapy advice, trauma advice, PTSD advice or personalised medical support. If a website assistant or chatbot were ever considered, it should be tightly limited to practical questions such as donations, volunteering, contact details and project information. Anything sensitive should be directed to a human contact or appropriate professional support.

A good first AI project would be an internal **content and impact assistant** that helps Susan turn existing knowledge and updates into structured drafts, while keeping final approval with the charity.

7. Volunteer and membership administration

Healing Hands Network's work depends on volunteers, including qualified therapists. There may be scope to create a simple **volunteer administration system** that reduces repetitive admin and makes onboarding easier.

This could begin with a secure form and tracker covering details such as name, contact information, qualifications, insurance, availability, project interest, documents submitted, emergency contact and application status. Automated confirmation emails

could acknowledge receipt and explain next steps. AI could potentially summarise applications or flag missing information, but final decisions should remain human-led.

This kind of system could also help with reporting. For example, the charity could more easily see how many active volunteers it has, what skills are available, who is ready for deployment, who needs follow-up, and where there may be gaps.

The important point is to keep it proportionate. A simple Airtable, Google Sheet, Microsoft List or lightweight database may be enough. There is no need for an expensive custom CRM unless the scale of the work justifies it.

8. Grant and funding support workflow

Another possible area is **grant and funding support**. AI can help with the early stages of grant work, especially where a charity needs to reuse similar organisational information across different applications.

A practical workflow could include a database of grant opportunities, eligibility notes, deadline tracking, standard organisational text, project descriptions, budget notes, impact data and draft application answers.

AI could help prepare first drafts, but all figures, claims and commitments would need human checking. This could save time while keeping control with Susan and the trustees.

[Charity Digital](#) is also worth reviewing for charity technology resources. It lists categories including CRM systems, data visualisation, impact reporting, fundraising platforms, grant management, content management systems and email marketing. Charity Digital states that it has helped **77,000 charities** save more than **£284m** on software since 2001 (**Charity Digital, accessed 2 July 2026**).

9. GivingLottery and recurring micro-support

Healing Hands Network appears to be listed on GivingLottery, with a page where supporters can select Healing Hands Network as their chosen cause (**GivingLottery, accessed 2 July 2026**). GivingLottery's public information states that **60% of ticket sales go to good causes**. More specifically, its good-cause model should be checked carefully because the selected cause and wider good-cause allocation may be treated separately. GivingLottery also states that 50 tickets a week can raise over **£1,040 per year** for a good cause (**GivingLottery, accessed 2 July 2026**).

The opportunity here is not necessarily technical development, but better integration. If Healing Hands Network is already using GivingLottery, it could be included more visibly in the website's support journey and in occasional scheduled social media posts. It may

be particularly useful for supporters who cannot give large amounts but are comfortable with small recurring support.

Because lotteries are regulated, it is sensible to rely on an established licensed platform rather than attempting to run an independent online lottery.

10. Free or discounted technology resources

A number of free or discounted tools may be relevant, subject to eligibility and whether Susan and the trustees want to use them.

[Google for Nonprofits](#) may be useful because it can unlock Google Ad Grants and other Google nonprofit tools. Google Ad Grants offers eligible nonprofits up to **\$10,000 USD per month** in search advertising (**Google Ad Grants, accessed 2 July 2026**).

[Canva for Nonprofits](#) may also be useful because Canva says eligible nonprofits can access Canva Pro features and collaboration tools for up to **50 users** free of charge (**Canva, accessed 2 July 2026**). This could help with social graphics, campaign images, event posters, simple reports and reusable templates.

[Charity Digital](#) is worth reviewing for discounted software and charity technology resources. Charity Digital's product categories include CRM systems, data visualisation, impact reporting, fundraising platforms, grant management and email marketing (**Charity Digital, accessed 2 July 2026**).

For email updates, [Brevo](#) has a free plan with **300 email sends per day**. Brevo's help material states that the daily limit resets each day and unused sends do not roll over (**Brevo, accessed 2 July 2026**). Any email system would need to be reviewed against the size of the mailing list, GDPR requirements, consent records and the charity's preferred way of communicating with supporters.

11. Comparable examples

The examples below are not included to suggest that Healing Hands Network should copy larger charities. They are included as **technical reference points** for how organisations present impact, donation routes, reporting and practical activity online.

Nova Ukraine is a useful example of a humanitarian organisation presenting impact figures and activity clearly. Its public website includes headline figures such as total aid delivered and other impact indicators (**Nova Ukraine, accessed 2 July 2026**).

DEC's Ukraine Humanitarian Appeal is a good example of transparent appeal reporting. Its page explains the amount raised, the number of people helped, the appeal closure date and the timeframe for spending funds (**DEC, accessed 2 July 2026**).

British Red Cross's Ukraine page is a useful example of a crisis/humanitarian page that presents the context, the response and practical support activity in one place. It includes headline figures about the Red Cross and Red Crescent movement's response, including food and hygiene kits distributed, people supported with clothing and household items, and people trained in first aid (**British Red Cross, accessed 2 July 2026**).

Ukrainian Action is relevant because it has a practical vehicle-and-aid convoy model. One public update describes its 40th convoy and 200th vehicle, alongside donated vehicles and physical goods (**Ukrainian Action, 2023**).

Veterans Aid is a useful veterans-sector comparison because it publishes impact reports and annual reports showing how it supports ex-service personnel in crisis (**Veterans Aid, accessed 2 July 2026**).

SSAFA is another veterans-sector reference point because it publishes annual reports and annual review/impact reports. Its reports page states that SSAFA supported more than **54,000 people** during 2024 through its range of services (**SSAFA, accessed 2 July 2026**).

The main lesson from these examples is that impact can be made visible in many ways: headline numbers, short case studies, project updates, campaign totals, delivery records, photos, annual reports and donor updates. Healing Hands Network could adopt a small-scale version that fits its own capacity and tone.

12. Suggested first phase of work

The most useful first phase would probably be a **digital foundations review**, rather than a large rebuild.

This could include reviewing the website setup, checking hosting and CMS access, backing up the current site, mapping current donation routes, checking Google indexing, setting up or reviewing Search Console and analytics, identifying simple SEO improvements, and producing a short list of low-risk changes.

Alongside that, it would be useful to create a small **impact data template**. This could be a simple spreadsheet or database that records activity in a way that can later feed the website, social media, grant applications and trustee reporting.

A first phase could therefore produce three practical outputs.

1. Technical website and access audit

This would establish what systems exist, who has access, how the site is hosted, whether backups exist, whether the site is reliably accessible, and what can realistically be changed.

2. Donation and support journey map

This would map the existing support routes — including JustGiving, GoFundMe, GivingLottery, Gift Aid-related processes and any existing standing order or sponsorship forms — and show how they connect to the website and social media.

3. Impact data and reporting template

This would give Susan and the charity a simple structure for recording activity and turning it into updates, reports and funding evidence.

13. Possible second phase

A second phase could focus on implementation. Depending on access and Susan's preferences, this could include a refreshed support page, improved project pages, a simple impact page, Google Search Console setup, structured data, Meta Business Suite scheduling, Canva templates, and a basic AI-assisted content workflow.

The aim would be to make regular updates easier, not to create a system that requires more work to maintain.

14. Possible third phase

A third phase could look at more advanced but still practical tools, such as a volunteer onboarding tracker, a grant application workflow, a small internal knowledge base, or a safe website FAQ assistant.

These should only be considered once the foundations are clear and the charity is comfortable with the data protection and governance implications.

15. Safeguards

Because Healing Hands Network works with trauma, war, veterans and potentially vulnerable people, the data and AI side should be handled carefully.

AI tools should not be used with sensitive personal data unless there has been a proper data protection review. They should not be used to provide therapy, PTSD, medical or crisis advice. Any AI-generated public content should be reviewed by a human before publication. Claims about impact, donations or outcomes should be evidence-based and traceable to records.

The charity should also be careful about photographs, personal stories and details from conflict settings. Consent, dignity and safeguarding should remain central.

16. Overall recommendation

The most useful contribution from a data science, AI and technical perspective would be to help Healing Hands Network make its existing work **easier to manage, measure and share**.

Rather than starting with a large redesign, the suggested approach is to begin with practical foundations: **access audit, website review, donation journey mapping, search visibility, impact data capture and a light-touch content workflow**. From there, the charity could move into more advanced work such as Google Ad Grants, AI-assisted reporting, volunteer administration and grant support.

The key principle is that any technical work should reduce Susan's workload, support the charity's existing strengths, and make it easier for supporters, volunteers and donors to understand and engage with the work already being done.
